

gives up only
Pareto efficiency,
so the filter
never moves

gives up Pareto efficiency
and independence, which
fails directly (at $V = 3$,
 $\Omega = 1$ through the tie rule)

gives up independence:
Pareto efficient, so
Arrow's theorem
forces the failure

$$1/(V-1)$$

$$V-1$$

Ω

ArrowFlow's layers: $\Omega < 12.8 < 15 \leq V-1$
